

## GM crops and consumer rights

**Summary:** Under current EU rules, GM food must be clearly labelled. A new opinion survey shows that this is in line with consumers' expectations across all EU countries. But these rules are under attack from multinational seed companies like Bayer, Corteva and Syngenta. They demand that food produced from certain GM crops engineered with new gene technology be excluded from the scope of EU regulations governing GM organisms (GMOs), including GMO labelling rules. The Greens/EFA warn that this would deprive consumers of their right to know how their food is produced, and leave them no opportunity to avoid GM food.

### GM crops 1.0 - GM crops made with older-style gene technology

Under EU legislation, a genetically modified (GM) organism is defined as “an organism, with the exception of human beings, in which the genetic material has been altered in a way that does not occur naturally by mating and/or natural recombination”<sup>1</sup>. GM organisms need to be authorised prior to their release into the environment or use as food and feed, based on a safety evaluation.<sup>2</sup>

Today, this concerns mainly agricultural crops such as maize and soya. Most of these GM crops are grown in the Americas.<sup>3</sup> In the EU, only one GM maize variety is authorised for cultivation. It is grown in small quantities in Spain and Portugal.<sup>3</sup> Most EU countries have banned the cultivation of GM crops in all or part of their territories.<sup>4</sup> But the EU has authorised many GM crops for use as food and feed, and it imports large amounts of them.<sup>5</sup>

Sales of GM seeds are dominated by the Big Four agricultural corporations Bayer, Corteva (former DowDupont), Syngenta and BASF.<sup>6</sup> These companies all produce agrichemicals as well, and the vast majority of GM crops that are grown today are engineered to survive spraying with herbicides that would normally kill them, and that are produced by the same company.<sup>7</sup>

### GM crops 2.0 - GM crops engineered with gene editing

The GM crops grown today have DNA from other species introduced into their genome. The fact that they tolerate spraying with toxic herbicides, for example, is achieved by inserting a gene from a soil bacterium.<sup>8</sup> With so-called gene-editing technology, genetic engineers can introduce additional DNA or modify or knock out (i.e. delete the function of) existing genes. One of the gene-editing tools is the CRISPR/Cas ‘gene scissors’.<sup>9</sup>

So far, only two gene-edited GM crops are grown commercially in the US, one of them also in Canada.<sup>10</sup> In the EU, such GM crops are currently grown on test fields in Belgium, Spain and Sweden.<sup>11</sup> The Big Four agricultural corporations have not yet brought any gene-edited crops to the market. But most patent applications for such crops have been filed by Corteva (former DowDupont) and Bayer.<sup>12</sup>

Most Europeans have never heard of gene editing. A Eurobarometer poll of 2019 showed that only 21% of respondents had heard of gene editing.<sup>13</sup> In early 2021, 37% of those polled had heard of it. This number includes people who “know nothing” or “know a little” about gene editing. By contrast, 78% of respondents had heard of GM crops more generally, ranging from 61% in Portugal to 93% in Poland.

In the EU, gene-edited crops are covered by EU GMO regulations.<sup>14</sup> The European seed industry refers to gene editing as ‘plant breeding innovation’ and demands that a wide range of gene-edited GM crops be excluded from EU GMO regulations.<sup>15</sup> The Commission will communicate its views on the matter at the end of April 2021.

## GMO labelling in the EU

EU legislation introduced in 2003 states that

- in the case of pre-packaged GM food/feed products, the list of ingredients must indicate “*genetically modified*” or “*produced from genetically modified [name of the organism]*”;
- in the case of products without packaging these words must still be clearly displayed in close proximity to the product (e.g a note on the supermarket shelf).

Consumers are practically unaware of these labels since retailers do not usually stock GM food, and few GM food products are on sale.<sup>16</sup>

Products from animals fed with GM crops are exempt from GMO labelling. In some EU countries, “non-GMO” labelling schemes have been set up to close that gap, and the range of animal products labelled that way is rapidly growing.<sup>17</sup>

In early 2021, across the EU, 86% of those who had heard about GMOs believed that food made from such crops should be labelled accordingly. A similar proportion (81%) believed that food produced from animals fed with GM crops should be labelled this way. Around 68% of respondents who had heard about new GM techniques such as CRISPR/Cas wanted the products derived from those techniques labelled. An extremely low number of respondents (3%) agree with the industry’s proposal to exempt these products from GMO safety testing and labelling.

## EU Green Deal

In the Farm-to-Fork Strategy, an integral part of the EU Green Deal, the European Commission has said the EU should better inform consumers about the food they are buying. The Commission aims to introduce food labelling that covers also environmental and social aspects of food production.<sup>18</sup>

At the same time, the Commission is considering industry demands to exempt certain gene-edited GM crops from the scope of EU GMO regulations, including GMO labelling rules. This would mean that consumers' right to know what is on their plates is restricted rather than broadened.<sup>19</sup>

The Greens/EFA group in the European Parliament insist that existing EU rules must be maintained and strengthened. We are asking that the labelling gap for products produced from animals fed with GM crops be closed.

## **GMO survey data**

Between 11 February and 5 March 2021, Ipsos conducted an opinion poll for the Greens/EFA Group in the European Parliament among its standing panels of online respondents in 27 EU countries.

The sample consisted of around 1,000 adults aged 18 and over in each country, with the exception of Cyprus, Luxembourg and Malta, where the sample size was 200. The data is weighted so that each country's sample composition best reflects the known demographic profile of the adult population according to the most recent census data.

These are the findings:

### **On GM crops made with older-style gene technology**

- A majority of respondents across the EU (78%) and in all EU countries said they had heard of GM crops, ranging from 61% in Portugal to 93% in Poland.
- Across the EU, 86% of those who had heard about GMOs believed that food made from such crops should be labelled accordingly.
- A similar proportion (81%) believed that food produced from animals fed with GM crops should be labelled this way.

### **On GM crops engineered with gene editing**

- In no EU country apart from Malta, had a majority of respondents heard of newer methods of genetic engineering like gene editing. Across the EU, this figure was 40%, only in Malta it was 57%.
- Across the EU, 68% of respondents who had heard about new GM techniques such as CRISPR/Cas, believed that products derived from those techniques should be labelled as GMOs.
- An extremely low number of the respondents (3%) said these products should not be assessed for their safety or labelled.

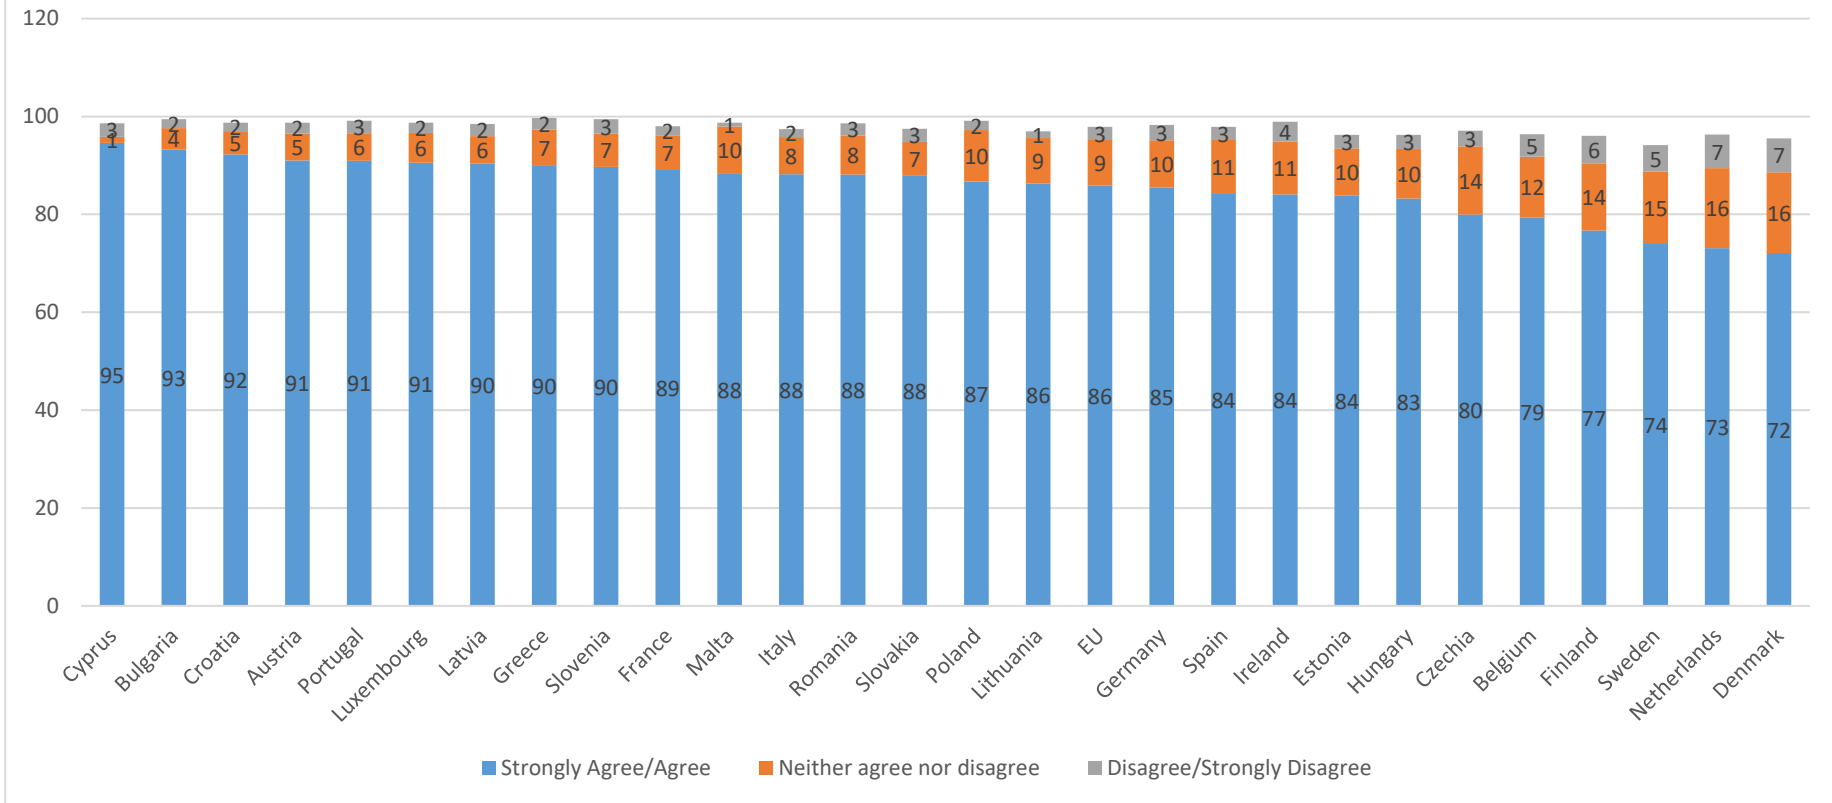

## AWARENESS OF GM CROPS (%)

Base: All respondents

Question: Have you ever heard of GM crops?

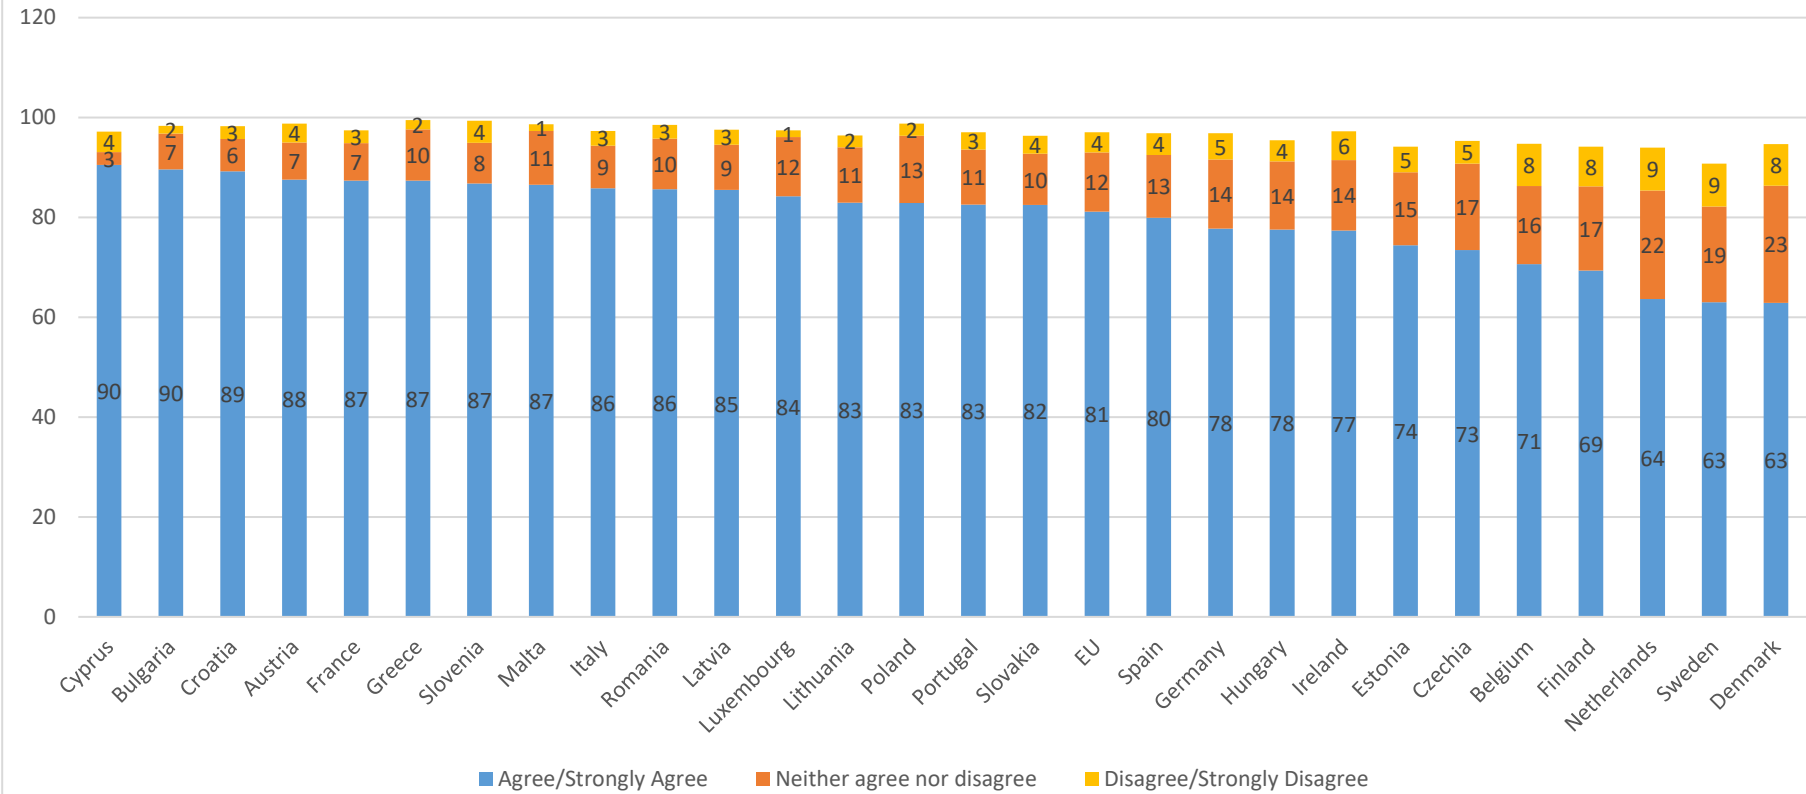

## Food made from GM crops should be clearly labelled (%)

Base: All who had heard of GM crops

Question: To what extent do you agree or disagree with the statement that 'Food made from GM crops should be clearly labelled'

## Food produced from animals fed with GM crops should be clearly labelled (%)

*Base: All who had heard of GM crops*

*Question: To what extent do you agree or disagree with the statement that 'Food produced from animals fed with GM crops should be clearly labelled'*

## AWARENESS OF NEW GENE EDITING METHODS (%)

*Base: All respondents*

*Question: Scientists have recently developed new methods of creating genetically modified crops or plants. These methods are sometimes referred to as “gene editing”, “CRISPR” or “gene scissors”. To what extent are you aware of these new methods?*

## ATTITUDES TOWARDS GENE EDITING (%)

Base: All who have heard of new methods of gene editing

Question: Which of the following comes closest to your view? Crops produced using these newer methods...
